

Lecture 5: Spatial autocorrelation

Instructor: Michael Szell

Mar 3, 2022

Today you will learn about spatial correlation

Questions to ask in
Exploratory spatial
data analysis

Use in Python
with example

Global and local
measures

$$I = \frac{n}{\sum_i \sum_j w_{ij}} \frac{\sum_i \sum_j w_{ij} z_i z_j}{\sum_i z_i^2}$$

$$I_i = \frac{z_i}{m_2} \sum_j w_{ij} z_j ; m_2 = \frac{\sum_i z_i^2}{n}$$

Exam project info

GDS asks: How do things relate in space?

Everything is related to everything else,
but near things are more related than
distant things.

Tobler's 1st law of geography

ESDA: Exploratory Spatial Data Analysis

Assumption-free investigation

of spatial patterns

with statistical techniques

ESDA: Exploratory Spatial Data Analysis

Assumption-free investigation of spatial patterns with statistical techniques

Answer:

Is a variable concentrated over space?

Do similar values locate closeby? If so where?

Given a choropleth map, is there a significant statistical pattern?

ESDA: Exploratory Spatial Data Analysis

Assumption-free investigation of spatial patterns with statistical techniques

Answer:

Is a variable concentrated over space?

Do similar values locate closeby? If so where?

Given a choropleth map, is there a significant statistical pattern?

Ask:

What process is behind a pattern?

Why are there certain clusters?

Spatial autocorrelation: Positive vs. Negative

Is the spatial counterpart of traditional correlation

Positive

similar values are closeby

Negative

similar values are further apart

?

Spatial autocorrelation: Positive vs. Negative

Is the spatial counterpart of traditional correlation

Positive

similar values are closeby

Negative

similar values are further apart

Spatial autocorrelation: Positive vs. Negative

Is the spatial counterpart of traditional correlation

Positive

similar values are closeby

income, poverty, covid cases,
vegetation, temperature,...

Negative

similar values are further apart

Spatial autocorrelation: Positive vs. Negative

Is the spatial counterpart of traditional correlation

Positive

similar values are closeby

income, poverty, covid cases,
vegetation, temperature,...

Negative

similar values are further apart

tigers, pharmacies, fire/police/
metro stations, hospitals,...

WHY DO COMPETITORS OPEN THEIR STORES NEXT TO ONE ANOTHER?

TEDEd

Spatial autocorrelation: Global vs. Local

Is the spatial counterpart of traditional correlation

Global

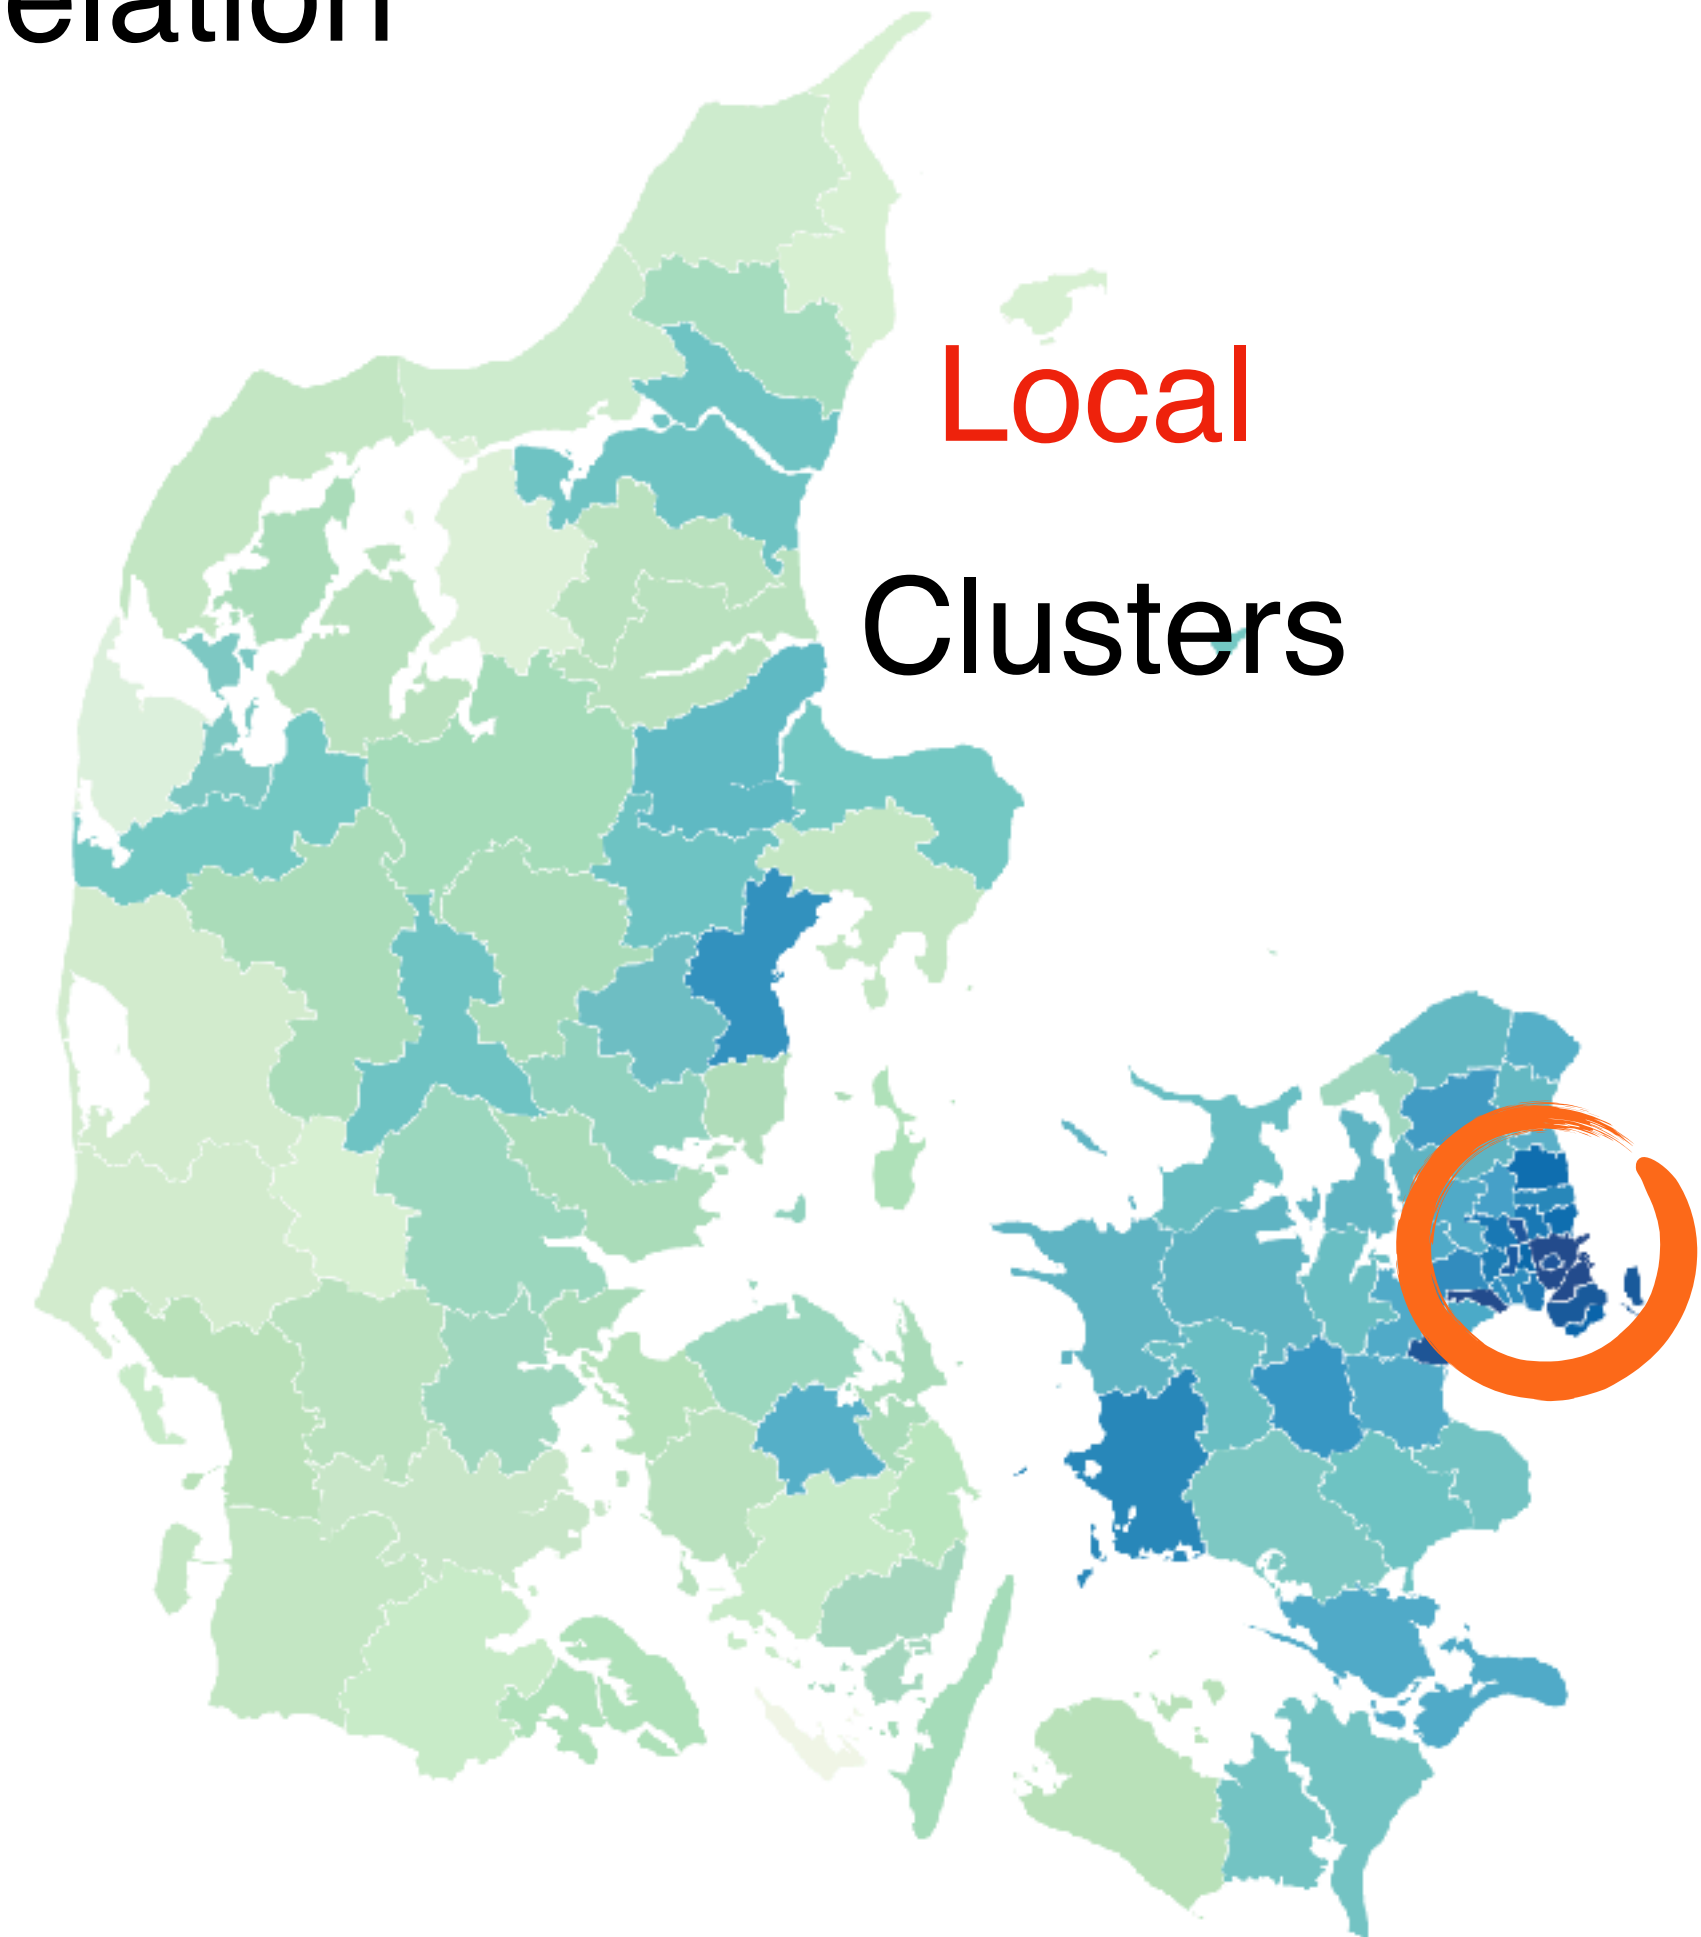

Clustering

Do values tend to be close to (dis)similar values?

Local

Clusters

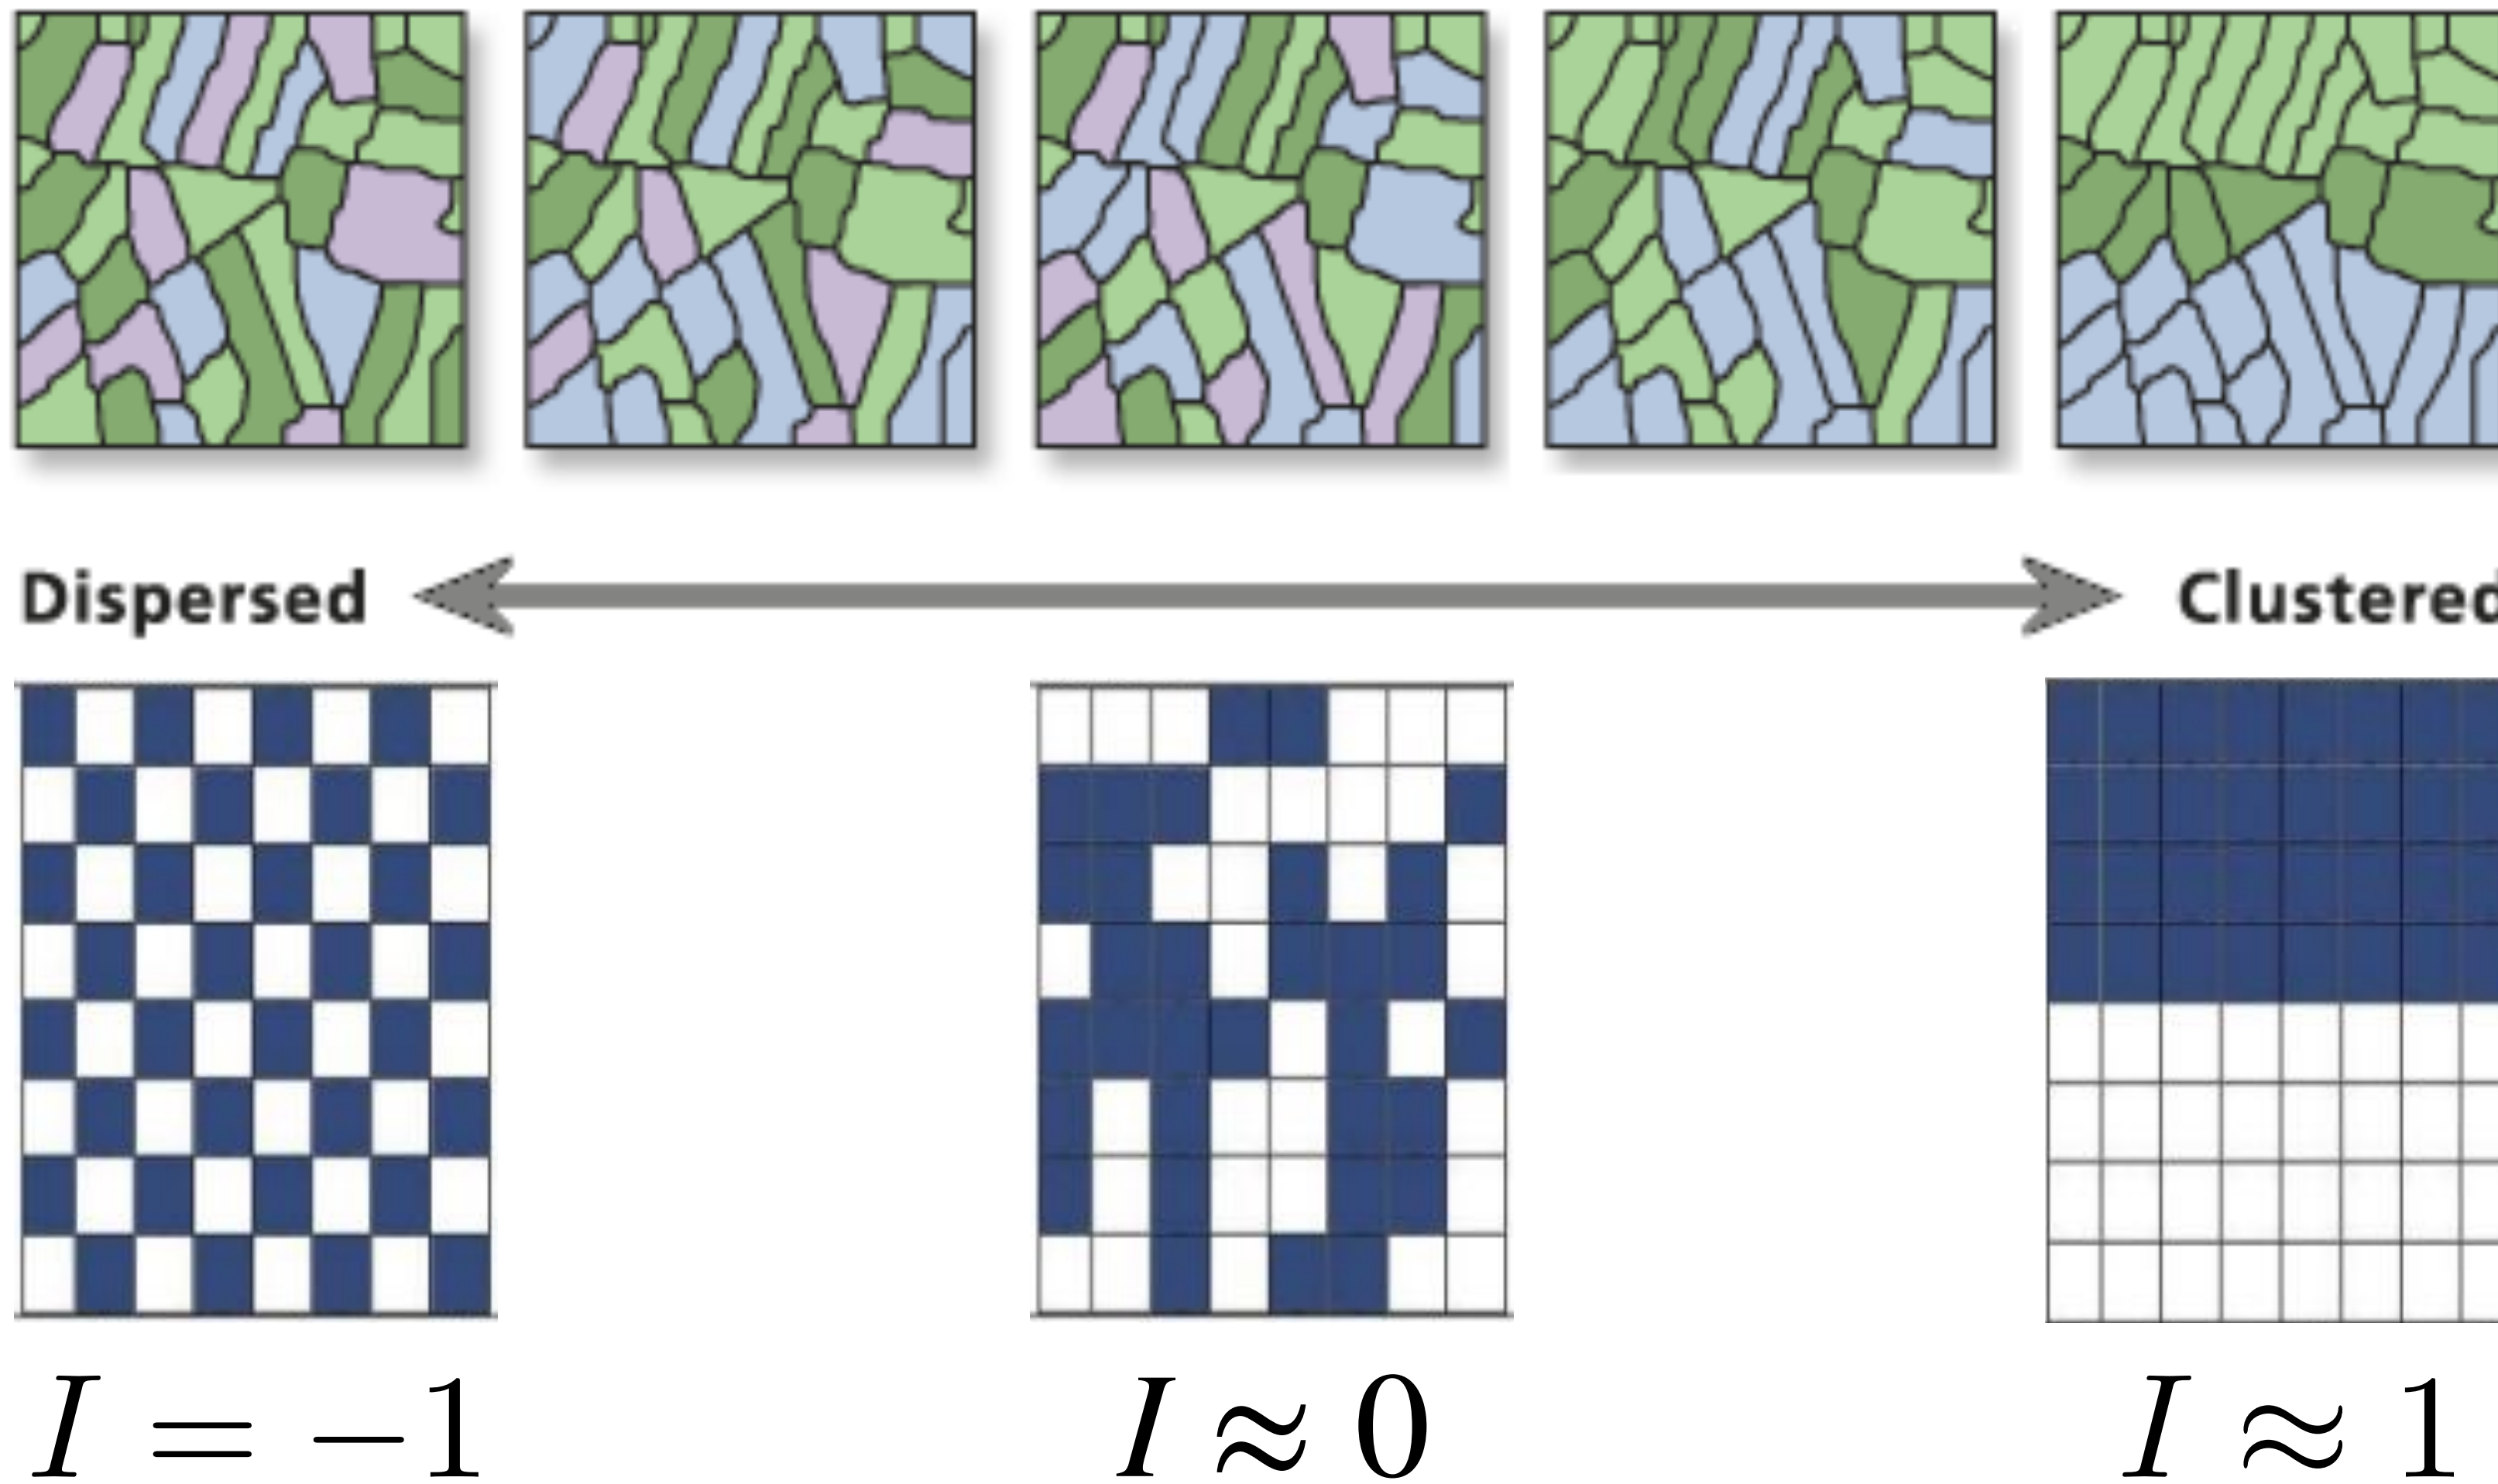

Are there areas with an extraordinary concentration of (dis)similar values?

Global Spatial Autocorrelation

Global spatial autocorrelation: Moran's I

Moran's I measures the average correlation between the value of a variable at one location and the value at nearby locations.

Global spatial autocorrelation: Moran's I

Moran's I measures the average correlation between the value of a variable at one location and the value at nearby locations.

Statistical inference with a significance value:
How likely is it to obtain a map like observed from a purely random pattern?

$$I = -1$$

$$I \approx 0$$

$$I \approx 1$$

Global spatial autocorrelation: Moran's I

Moran's I measures the average correlation between the value of a variable at one location and the value at nearby locations.

$$y_i$$

$$y_{\text{lag},i} = \sum_{j=1}^n w_{ij} y_j$$

$$\rho = \frac{1}{n-1} \sum \left(\frac{y_i - \bar{y}}{s_y} \right) \left(\frac{x_i - \bar{x}}{s_x} \right)$$

Global spatial autocorrelation: Moran's I

Moran's I measures the average correlation between the value of a variable at one location and the value at nearby locations.

$$y_i$$

$$y_{\text{lag},i} = \sum_{j=1}^n w_{ij} y_j$$

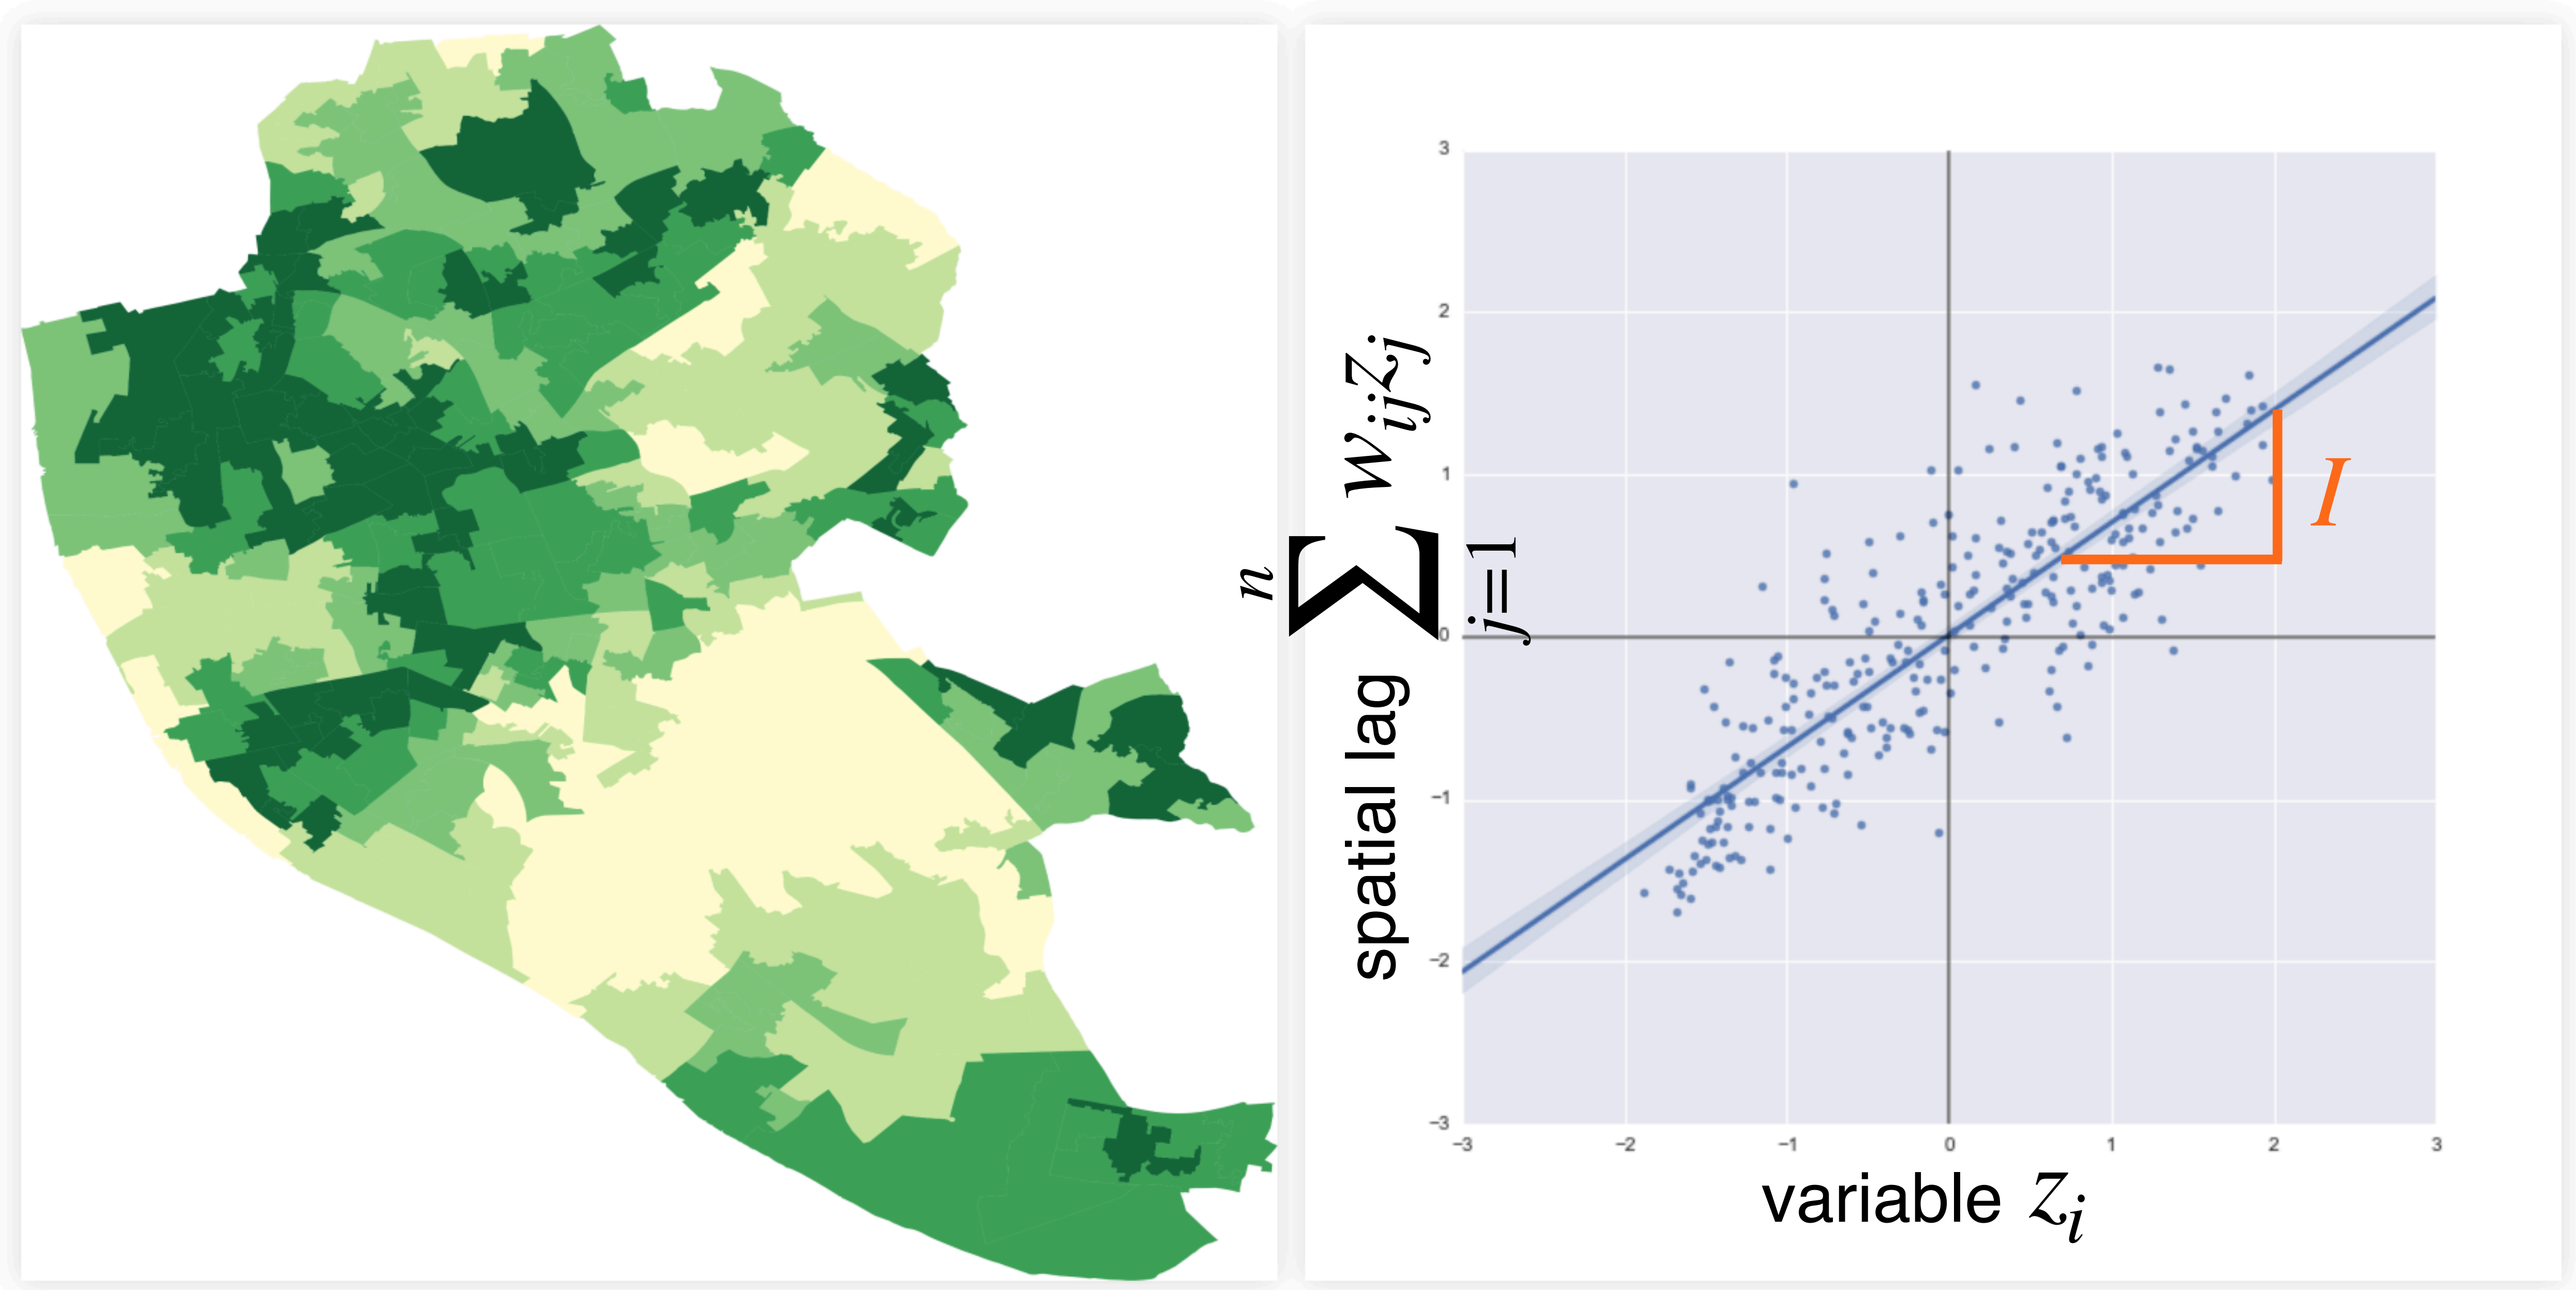

$$\rho = \frac{1}{n-1} \sum \left(\frac{y_i - \bar{y}}{s_y} \right) \left(\frac{x_i - \bar{x}}{s_x} \right)$$

If we call $z_i = \left(\frac{y_i - \bar{y}}{s_y} \right)$, then:

$$I = \frac{n}{\sum_i \sum_j w_{ij}} \frac{\sum_i \sum_j w_{ij} z_i z_j}{\sum_i z_i^2}$$

Moran's I is the regression slope in the **Moran plot**

Local Spatial Autocorrelation

Local spatial autocorrelation is about local clusters

Cluster = Portion of a map where values are correlated in a particularly strong or specific way

Local spatial autocorrelation is about local clusters

Cluster = Portion of a map where values are correlated in a particularly strong or specific way

Positive	High-High: Hotspot
	Low-Low: Coldspot
Negative	High-Low: Spatial outlier
	Low-High: Spatial outlier (donut)

LISA: Local Indicators of Spatial Association

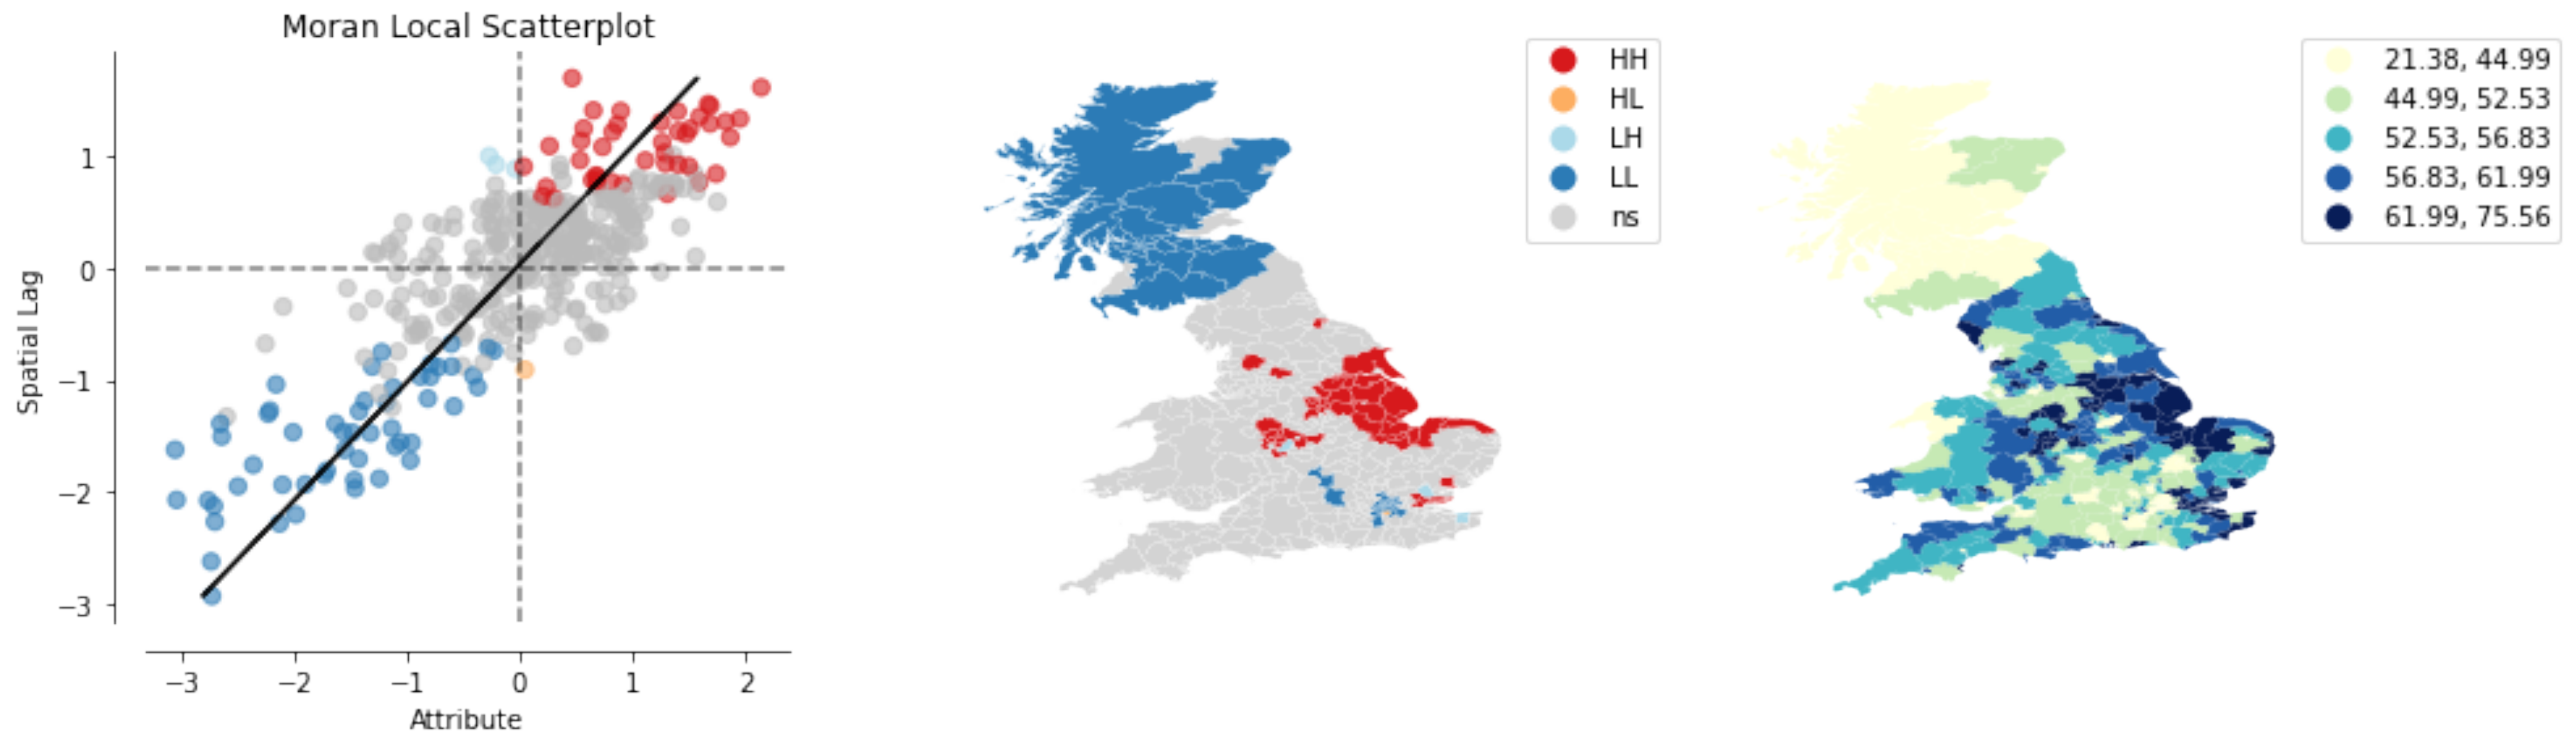

Like a "local Moran's I"

How much is each object's relation with its neighbors different from the relations of other objects and their neighbors on the map?

LISA: Local Indicators of Spatial Association

Like a "local Moran's I"

How much is each object's relation with its neighbors different from the relations of other objects and their neighbors on the map?

LISA: Local Indicators of Spatial Association

Like a "local Moran's I"

How much is each object's relation with its neighbors different from the relations of other objects and their neighbors on the map?

$$I_i = \frac{z_i}{m_2} \sum_j w_{ij} z_j ; m_2 = \frac{\sum_i z_i^2}{n}$$

$$\sum_i I_i = \gamma I$$

If W is standardized, then: $\gamma = \sum_i \sum_j w_{ij}$

Geospatial Data Science Exam Project Instructions, Spring 2022

The submission is a written project report about the application of geospatial data science either to **answer a research question** or to **create a prototype of a digital product**. It may range from a technical workflow proof of concept to research data exploration. The project should explore or solve a problem with a geospatial dimension and may focus on any aspect of spatial data collection, visualization, analysis, or statistical evaluation. The submission has two parts: (a) commented code deposited on Github (or similar code repository) and (b) the associated report that describes the project and links to the code repository.

If anything is left unclear after reading this document, please ask [in the forum](#) or Michael in class.

Project approval

Before starting to work on your project, you must form a group of 2 or 3 people, and submit a very short project proposal at the latest **by March 31st** at: [\[tinyurl link\]](#)

https://learnit.itu.dk/mod/page/view.php?id=155887

2	Example row	0	Michael Szell Anastasia Vybornova Ana Rahbek Viens	msz@itu.dk	Bicycle crashes London	We will research the spatial properties of bicycle crashes over the year 2021 in London using road crash data from the UK Dept for Transport (from https://data.gov.uk/dataset/d67ae8f0-4be6-4935-9277-47e5ca24a11f/road-safety-data , last update Nov 25 2021) and street network data from OpenStreetMap. We will study the spatial clustering of crashes, and relate them to variables such as weather, road type, speed limit, pavement, protected bicycle infrastructure. We will explore the spatial relations between these data, to get a better understanding of the factors that could influence or prevent crashes.
